

Future Scope

If more time would have been given to us then we can further add below mentioned things:

1. An android app for music recommendation system i. that save some frequent data locally on user's device to decrease response delay of system, ii. that allow keyword search of songs, albums, artists, etc, iii. That allow rating songs (optional not compulsory), iv. that can track user's geographical location so that users can get geographically local popular songs.
2. Due to lack of some details in already available dataset like i. Duration of song heard by user, ii. Ratings, etc so that we can apply some techniques which may play an important role in recommendation systems, if we would have given time than we could have created an app from which we can get such data from live users.
